

Presentation for the
Subcommittee on Disaster Reduction (SDR)
of the National Science and Technology Council (NSTC)

**The International
Register of
Alerting Authorities**

Presented April 5, 2012 by
Eliot Christian <echristian@usgs.gov>

Topics Outline

- What is the international Register of Alerting Authorities?
- Why is the Register necessary?
- What are the key features of the Register?
- How are the Register entries maintained?
- How are U.S. alerting authorities represented in the Register?

What is the international Register of Alerting Authorities?

- Established by WMO (Public Weather Services) and ITU-T (using the OID register)
- Identifies officially recognized alerting authorities, asserted by WMO Members (treaty among 183 nations and 6 territories)
- Register has categories of alert messages, plus URL's for forecasts and CAP messages
- Users of alert messages and others can subscribe to a news feed to stay current with any changes to the Register

Why is the Register necessary?

- Aggregators and other intermediaries typically lack direct knowledge needed to distinguish an authoritative source of alert messages
- This lack becomes more critical as alerting makes more use of large public networks
- The Register of Alerting Authorities is a reference to address that knowledge gap
- Each Register entry asserts that a particular source of alert messages is regarded by a WMO Member as authoritative for particular categories of hazards over a particular area

What are the key features of the Register?

Issuing Organization: National Oceanic and Atmospheric Administration

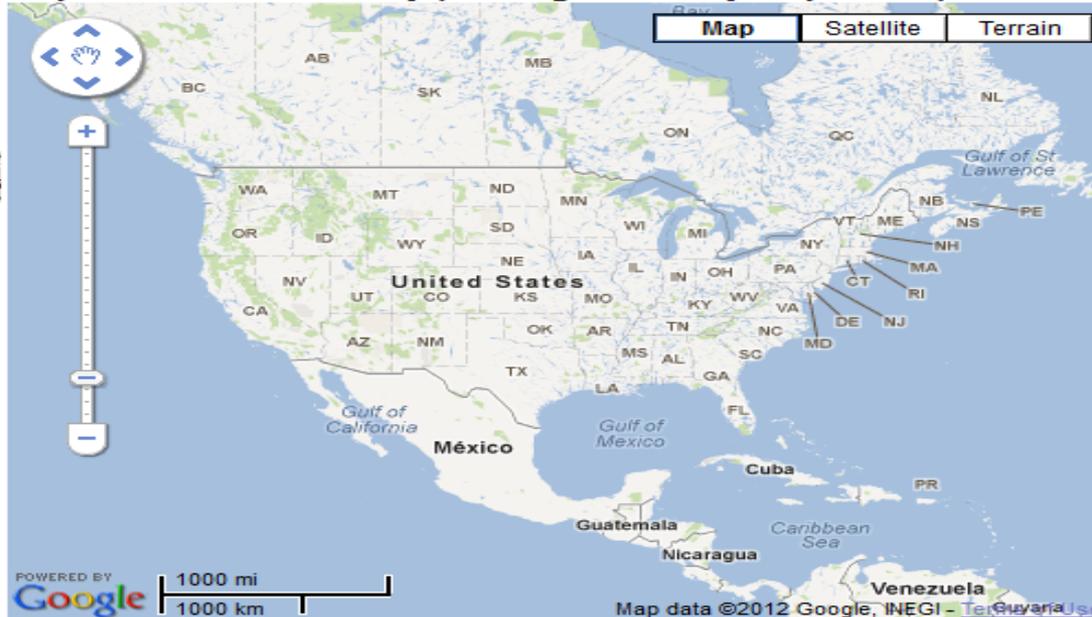

Hazard Categories: Geo Met Fire Health Env CBRNE

Authorization Basis: The National Weather Service Organic Act of 1890, currently codified as amended in section 313 of title 15 of the federal statutory code (called the United States Code) authorizes the National Weather Service to issue and distribute warnings of environmental hazards. The authority is summarized as: The National Weather Service (NWS) provides weather, hydrologic, and climate forecasts and warnings for the United States, its territories, adjacent waters and ocean areas, for the protection of life and property and the enhancement of the national economy. NWS data and products form a national information database and infrastructure which can be used by other governmental agencies, the private sector, the public, and the global community. In addition, the National Weather Service supports the Emergency Alert System and provides, in coordination with the Federal Emergency Management Agency, public dissemination of critical pre-event and post-event information of all hazards, including natural disasters and terrorist events. The National Weather Service all-hazards support authority emanates primarily from the National Response Framework as authorized by The Homeland Security Act of 2002, codified predominantly as amended in sections 101 to 557 of title 6 of the United States Code, and The Robert T. Stafford Disaster Relief and Emergency Assistance Act, codified as amended sections 5121 to 5206 of title 42 of the United States Code.

Hazard Categories

- Geo:** Geophysical (earthquakes, volcanoes, etc., includes landslide)
- Met:** Meteorological (weather, storms, etc. includes flood)
- Safety:** General emergency and public safety
- Security:** Law enforcement, military, homeland and local/private security
- Rescue:** Rescue and recovery
- Fire:** Fire suppression and rescue
- Health:** Medical and public health
- Env:** Pollution and other environmental
- Transport:** Public and private transportation
- Infra:** Utility, telecommunication, other non-transport infrastructure
- CBRNE:** Chemical, Biological, Radiological, Nuclear or High-Yield Explosive threat or attack
- Other:** Other events

Information:

Each Register entry shall include an OID arc {*joint iso-itu-t(2) alerting(49) wmo(0) authority(0) country(n)*}, where *n* is the numeric country code allocated by the United Nations Statistics Division and *country* is the ISO 3166-1 alpha-2 code. Assignment of this identifying OID arc is automatic upon designation of an initial editor of the WMO Register of Alerting Authorities.

Register entries are typically linked to a nation

How are the Register entries maintained?

- A Letter was sent to all PR's with WMO in November 2009 describing the Register
- Each PR should have responded by designating an “editor” to maintain the Register records for all alerting authorities asserted by the Member
- The editor is then approved by PWS and selects a personal password
- Each editor should then maintain the Register entries on behalf of the Member

How are U.S. alerting authorities represented in the Register?

“the National Weather Service...provides, in coordination with the Federal Emergency Management Agency, public dissemination of critical pre-event and post-event information of all hazards, including natural disasters and terrorist events. The National Weather Service all-hazards support authority emanates primarily from the National Response Framework as authorized by The Homeland Security Act of 2002, codified predominantly as amended in sections 101 to 557 of title 6 of the United States Code, and The Robert T. Stafford Disaster Relief and Emergency Assistance Act, codified as amended sections 5121 to 5206 of title 42 of the United States Code.”

<http://www-db.wmo.int/alerting/authorities.asp?reclId=177>

The U.S. has many alerting authorities

Update U.S. Entries in the Register

- Should SDR support NWS in updating the Register with U.S. Federal agency entries?
- Should Register entries correspond to the approved IPAWS COG 's?
